

## ***Futura GTS Internet Filtering System – Demonstration System***

### **Demo Setup**

We have configured a demonstration web filter that you can configure your home computer to use to test the filter. Note the following:

- The filter will **ONLY** work for websites (not peer-to-peer, instant messaging etc).
- The demo filter **WILL SLOW DOWN** your internet browsing because of the speed of our internet connection. Removing the demo settings will speed up your internet again.

The following describes the steps for configuring Internet Explorer, other browsers have similar procedures.

Open Internet Explorer  
Click on **Tools** in the menu bar  
Select **Internet Options ...**  
Click on the **Connections** tab  
Click on the **LAN Settings...** button  
Click in the box beside **“Use a proxy server for your LAN . . .”**  
In the Proxy Server settings boxes type in the following:  
    Address: webfilterdemo.futuragts.com  
    Port: 8080  
Click **OK** twice to save the settings and return to browsing the web.

To remove the settings from your computer follow the same steps but remove the check mark from **“Use a proxy server for your LAN . . .”**

### **Demo Administration Access**

We have also set up the demonstration web filter so that you can see the configuration screens and make changes to them. You can access the filter logs using the following information:

Website address: <https://webfilterdemo.futuragts.com:81> [Note the “s” in https ]

When prompted, accept the security certificate warning by clicking **Yes**

    Username: clientlogs

    Password: logs

To view a summary of the top 20 good and bad sites that have gone through the web filter today click **ONLY** the “denied” and “allowed” boxes and then click on **Run Report**.

If you wish to see the administration interface, please contact Fernand for the username and password.
